

EXPLORATION UPDATE: WHITEHEADS GOLD PROJECT

HIGHLIGHTS

- Assay results received for the 79-hole AC program drilled in late January
- Encouraging end-of-hole anomalism drilled at four prospects
- Highlights include
 - 4m @ 0.77g/t Au from 32m to EOH in 22WHAC075 and
 - 4m @ 0.14g/t Au from 32m to EOH in 22WHAC073 at Blue Poles South
 - 4m @ 0.91g/t Au from 48m in 22WHAC032 and
 - 1m @ 0.28g/t Au from 68m to EOH in 22WHAC026 at Eclipse
- Arsenal Trend remains the primary focus for ongoing work
- Further RC drilling planned to test deeper high-grade potential at Blue Poles
- RC drilling is ongoing at the Mulga Bill prospect at Side Well

Great Boulder Resources (“**Great Boulder**” or the “**Company**”) (ASX: **GBR**) is pleased to provide an exploration update on the Whiteheads project (“**Whiteheads**”) north of Kalgoorlie in Western Australia.

Assay results from 79 air-core (AC) holes drilled recently at Whiteheads have now been received. The program, completed at the end of January, was designed to test geochemical anomalies at six prospects including three areas along the Arsenal Trend.

The results continue to enhance the Company’s view that the Arsenal Trend has high potential for additional gold endowment, particularly south of the Blue Poles discovery. Results such as 4m @ 0.77g/t Au at the end of hole in 22WHAC075 compare favorably to the discovery holes at Blue Poles, where thick zones of supergene mineralisation were found by RC drilling beneath AC anomalies.

Elsewhere in the same program, intersections such as 4m @ 0.91g/t Au from 48m in 22WHAC032 at Eclipse and 4m @ 0.33g/t Au from 48m in 22WHAC002 at Lindsay’s South justify further work.

Great Boulder’s Managing Director, Andrew Paterson commented:

“With this program we started working on more regional targets at the south end of Whiteheads, but the results clearly highlight the Arsenal Trend as an ongoing priority for further drilling.”

“From the north end of Blue Poles down to Tektite we’ve now defined over 2.5km of a mineralised trend. We need to drill deeper RC at holes at Blue Poles to test the higher-grade potential plunging to the south, and then start testing these new prospects south of Blue Poles.”

“We also expect to have the AC rig back at Whiteheads in about a month, continuing first-pass drilling on additional geochemical targets defined within the broader project area.”

The Company is also waiting for assays from over 900 auger samples recently completed in the Wishbone area. Any geochemical targets resulting from this program will be tested in the next round of AC drilling.

FIGURE 1: RECENT AC RESULTS WITHIN THE ARSENAL TREND FROM BLUE POLES TO TEKTITE

This announcement has been approved by the Great Boulder Board.

About Great Boulder Resources

Great Boulder is a mineral exploration company with a portfolio of highly prospective gold and base metals assets ranging from greenfields through to advanced exploration located in Western Australia. The Company’s core focus is advancing the Whiteheads and Side Well gold projects while progressing initial exploration at the earlier stage Wellington Base Metal Project located in an emerging MVT province. With a portfolio of highly prospective assets plus the backing of a strong technical team, the Company is well positioned for future success.

Competent Person's Statement

Exploration information in this Announcement is based upon work undertaken by Mr Andrew Paterson who is a Member of the Australasian Institute of Geoscientists (AIG). Mr Paterson has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a 'Competent Person' as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' (JORC Code). Mr Paterson is an employee of Great Boulder Resources and consents to the inclusion in the report of the matters based on their information in the form and context in which it appears.

APPENDIX 1 - JORC CODE, 2012 EDITION TABLE 1**Section 1 Sampling Techniques and Data**

(Criteria in this section apply to all succeeding sections.)

Criteria	Commentary
<i>Sampling techniques</i>	<p>Air Core samples were collected over 1m intervals using a cyclone splitter with sample piles placed in rows on cleared ground next to the drill collar. The entire hole was composited over 4m intervals or less with scoop samples of each 1m pile combined in a calico sample bag.</p> <p>The sampling techniques used are deemed appropriate for the style of exploration.</p>
<i>Drilling techniques</i>	Drilling was undertaken by Prospect Drilling using a KL150 aircore rig. Industry standard air core methods and equipment were utilised.
<i>Drill sample recovery</i>	<p>Sample condition has been logged for every composited interval as part of the sampling process. Sample recovery was not recorded for this drill program</p> <p>No quantitative twinned drilling analysis has been undertaken.</p>
<i>Logging</i>	Geological logging of drilling followed established company procedures. Qualitative logging of samples includes lithology, mineralogy, alteration, veining and weathering. Abundant geological comments supplement logged intervals.
<i>Sub-sampling techniques and sample preparation</i>	1m cyclone splits and 4m composite samples were taken in the field. Samples were prepared and analysed by ALS in Perth. Samples were pulverized so that each sample had a nominal 85% passing 75 microns. A 50g allotment was then analysed by fire assay using Intertek method FA50/OE04.
<i>Quality of assay data and laboratory tests</i>	All samples were assayed by industry standard techniques.
<i>Verification of sampling and assaying</i>	A fine-grained blank and certified reference material were inserted every 50 samples. No duplicates were taken in this program. No QAQC problems were identified in the results. No twinned drilling has been undertaken.
<i>Data spacing and distribution</i>	<p>Drill spacing is varied for the entire AC drill program. The results reported above were obtained from drill holes spaced 50m apart on east-west lines.</p> <p>The spacing and location of data is currently only being considered for exploration purposes.</p>
<i>Orientation of data in relation to geological structure</i>	<p>Drilling is dominantly perpendicular to regional geological and geochemical trends where interpreted and practical.</p> <p>The spacing and location of the data is currently only being considered for exploration purposes.</p>

<i>Sample security</i>	GBR personnel were responsible for delivery of samples from the drill site to the assay laboratory.
<i>Audits or reviews</i>	None completed.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	Commentary
<i>Mineral tenement and land tenure status</i>	The project is located between 45 and 70km north-northwest of Kalgoorlie on the Yarri Road. The tenement package is comprised of two active Exploration Licenses and one EL application. The granted tenement E27/544 covers an area of approximately 185km ² including up to 15km of strike on a number of potential mineralized trends. Tenements E24/588 and ELA27/622 cover an additional 22 and 10 graticular blocks respectively. Once granted, these tenements will add approximately 49km ² to the project area.
<i>Exploration done by other parties</i>	<p>The Whiteheads project area has been the focus of exploration efforts dating back to the 1960's. The bulk of the earlier exploration efforts were focussed on the nickel potential of the region following discoveries at the Black Swan, Silver Swan and Carr Boyd deposits. Various exploration campaigns by multiple companies utilising differing methods have been undertaken for nickel, VMS and gold targets. The differing exploration and analysis techniques has resulted in a patchwork of exploration datasets that are not easily comparable.</p> <p>Small-scale historical gold workings are present within the tenure that have a protracted history of mining. Publicly available data for these deposits indicate selective mining of high-grade gold veins.</p>
<i>Geology</i>	<p>The Whiteheads Project lies proximal to the interpreted boundary between the Archean Kalgoorlie and Kurnalpi Terranes of the Eastern Goldfields Superterrane. This boundary also marks the separation of the Boorora (Kalgoorlie Terrane) and Gindalbie (Kurnalpi Terrane) Domains based on volcanic facies relationships. This boundary is marked by a zone of faulting and shearing historically called by various names including the Mt Monger (Swager and Griffin 1994) and Ockerburry Fault (Blewitt and Hitchman 2006). The Boorora Domain is dominated by mafic and ultramafic lithofacies with minor sediments and felsic volcanics. The Gindalbie Domain contains a significant package of bimodal volcanics, sedimentary units and lesser ultramafic lithologies. 3 separate greenstone succession have been recognized within the Gindalbie Domain, with the uppermost bi-modal formation the only one present within the project area. The above successions have experienced at least 4 phases of deformation and display mid-greenschist facies metamorphism.</p> <p>The project area contains a significant amount of transported cover consisting of colluvium, sand plains and laterite. Tertiary aged paleochannels transect the project area. Tertiary duricrust comprises insitu lateritic duricrust to colluvium products derived from insitu material.</p> <p>Several historic workings are located within the project area including the historic Whitehead Find, Patches, Seven Leaders, Lady Betty and Jewellery Box gold workings along with widespread shallow workings. Gold mineralisation is related to extensive shearing and quartz veining along lithological contacts. The Whiteheads Project is located directly along strike to the north of KalNorth Gold Mines Limited's Lindsay Gold project. No definitive nickel mineralisation has been identified to date within the project area however the Black Swan, Silver Swan and Carr-Boyd Nickel deposits are all located within the region and the project remains prospective for further nickel discoveries.</p>
<i>Drill hole Information</i>	A list of the drill hole coordinates, orientations and metrics are provided as an appended table.
<i>Data aggregation methods</i>	<p>No grade truncations were applied to these exploration results.</p> <p>A weighted average calculation was used to allow for bottom of hole composites that were less than the standard 4m.</p>

	No metal equivalents are used.
<i>Relationship between mineralisation widths and intercept lengths</i>	<p>The orientation of structures and mineralisation is not known with certainty, but majority of the drilling was conducted using appropriate perpendicular orientations for known geology and geochemical anomalism.</p> <p>A list of the drill holes and orientations is provided as an appended table.</p>
<i>Diagrams</i>	Refer to figures in announcement.
<i>Balanced reporting</i>	It is not practical to report all historical exploration results from the Whiteheads project. Full drillhole details can be found in publicly available historical annual reports.
<i>Other substantive exploration data</i>	Exploration undertaken on the Whiteheads Project between 2015-2019 was by private company Zebina Minerals Pty Ltd and Kalgoorlie based prospectors. Previous work over the Arsenal trend is limited to one line of AC drilling
<i>Further work</i>	Further work is discussed in the document in relation to the exploration results.
